

SUMMER – 2023 EXAMINATION
Model Answer – Only for the Use of RAC Assessors

Subject Name: Data Structure Using C

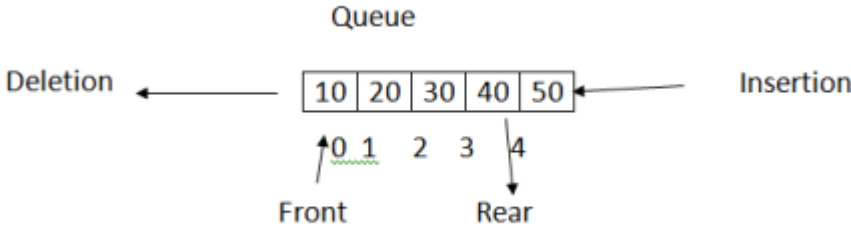

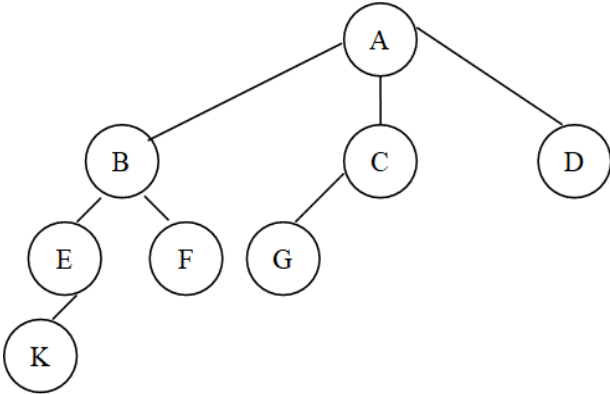

Subject Code: 22317

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English + Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Q. No.	Sub Q. N.	Answer	Marking Scheme
1		Attempt any <u>FIVE</u> of the following:	10 M
	a)	Write any four operations performed on data structure.	2 M
	Ans	Insert Traverse Create Destroy Select Update Copy Merge Search Sort	Each one carries ½ M

	b)	Draw the diagram of Linear Queue to represent front and rear pointers.	2 M
	Ans	<p style="text-align: center;">Queue</p> 	Correct diagram carries - 2 M
	c)	State the following terms: (i) Leaf node of a tree (ii) Degree of a tree	2 M
	Ans	<p>Leaf Node: Leaf node is a terminal node of a tree. It does not have any nodes connected to it. K, F, G, and D are leaf nodes. All other nodes are called non-leaf nodes or internal nodes</p> <p>Degree of the Tree: The degree of a tree is the maximum degree of the nodes in the tree. The degree of the shown tree is 3.</p> 	Each definition with example carries – 1 M
	d)	Write any two operations performed on the stack.	2 M
	Ans	1) Push 2) Pop 3) Stack overflow 4) Stack underflow.	Each operation carries – 1 M
	e)	What are directed and undirected graphs ?	2 M
	Ans	<p>Directed Graph: A directed graph G is also called digraph which is same as a multigraph except that each edge e in G is assigned a direction or in other words, each edge in G is identified with an ordered pair (U,V) of nodes in G rather than an unordered pair.</p>	Each type carries – 1 M

$G=(V,E)$
 $V(G)=\{V1,V2,V3,V4\}$
 $E(g)=\{(V1,V2),(V1,V4),(V2,V4), (V1,V3)\}$

Undirected Graph: An undirected graph G is a graph in which each edge e is not assigned a direction.

		 <p>$G=(V,E)$ $V(G)=\{V1,V2,V3,V4\}$ $E(g)=\{(V1,V2),(V1,V4),(V2,V4), (V1,V3)\}$</p> <p>Undirected Graph: An undirected graph G is a graph in which each edge e is not assigned a direction.</p>   	
	f)	Explain linear and non-linear data structures.	2 M
	Ans	<p>A linear data structure is one in which the components are stored in a sequential order and are linked to the elements before and after them. Array, Stack, Queue, Linked list, and other linear data structures are examples.</p> <p>When the data items or pieces of a data structure are not placed sequentially or linearly, the data structure is called to be non-linear.</p> <p>Because the items are not stored sequentially, they cannot be traversed or retrieved in a single iteration that is the single level is not engaged in non-linear data structures.</p> <p>In terms of implementation, a non-linear data structure is difficult. When compared to linear data structures, they make better use of system memory.</p> <p>Tree and graph are examples of non-linear data structures. The tree data structure contains a hierarchical relationship. Non-linear data structures are memory efficient because they do not require a memory allocation in advance, as previously stated.</p>	Explanation carries – 1 M
	g)	Define Searching. What are its types?	2 M
	Ans	<p>Searching is an operation or a technique that helps finds the place of a given element or value in the list. Any search is said to be successful or unsuccessful depending upon whether the element that is being searched is found or not. Some of the standard searching technique that is being followed in the data structure is listed below:</p> <ul style="list-style-type: none"> Linear Search or Sequential Search Binary Search 	Correct def: 1m, types- 1m
2.		Attempt any <u>THREE</u> of the following:	12 M
	a)	Sort the following elements using Radix Sort Method:	4 M

{361, 12, 527, 143, 9, 768, 3481}.

Ans

First Iteration: Sort the numbers according to Unit place

Inputs	Pockets									
	0	1	2	3	4	5	6	7	8	9
0361		0361								
0012			0012							
0527								0527		
0143				0143						
0009										0009
0768									0768	
3481		3481								

Output = {0361,3481,0012,0143,0527,0768,0009}

Second Iteration: Sort the numbers according to 10th place

Inputs	Pockets									
	0	1	2	3	4	5	6	7	8	9
0361							0361			
3481									3481	
0012		0012								
0143					0143					
0527			0527							
0768							0768			
0009	0009									

Output = {0009,0012,0527,0143,0361,0768,3481}

Third Iteration: Sort the numbers according to 100th place

Inputs	Pockets									
	0	1	2	3	4	5	6	7	8	9
0009	0009									

Each
iteration
carries – 1
M

0012	0012										
0527						0527					
0143		0143									
0361				0361							
0768								0768			
3481					3481						

Output = {0009,0012,0143,0361,3481,0527,0768}

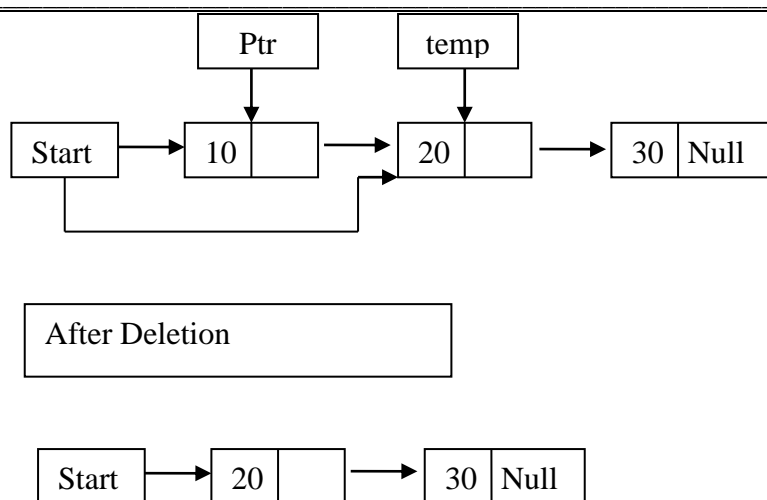

Fourth Iteration: Sort the numbers according to 1000th place

Inputs	Pockets									
	0	1	2	3	4	5	6	7	8	9
0009	0009									
0012	0012									
0143	0143									
0361	0361									
3481				3481						
0527	0527									
0768	0768									

Output = {0009,0012,0143,0361,0527,0768,3481}

Sorted Numbers are = 0009,0012,0143,0361,0527,0768,3481

	b)	Write an algorithm to delete a node at the beginning from a singly Linked List.	4 M
	Ans	Deletefirst(start) 1. [check for Underflow] if start=NULL then print 'List is Empty' exit endif 2. set Ptr=start 3. set start=start->next 4. print 'Element deleted is Ptr->info' 5. free(Ptr)	Correct logic carries – 4 M

c) Explain stack overflow and underflow conditions with example.

4 M

Ans **Stack Overflow condition:** When stack is completely full (i.e. $TOP = MaxSize - 1$) and we try to insert more element onto stack then this condition is called overflow condition and no further element could be inserted now until any element is deleted.

Stack Overflow: This is the situation when the stack becomes full, and no more elements can be pushed onto the stack. At this point the stack top is present at the highest location of the stack.

Push e

D	Top=4
C	Top=3
B	Top=2
A	Top=1

Top=0

Underflow Condition: When a stack is empty (i.e. $TOP = -1$) and we try to delete more element from it, then this condition is called underflow condition.

Stack empty or underflow: This is the situation when the stack contains no element. At this point, the top of stack is present at the bottom of the stack.

Pop

Top=0

stack
overflow
and
underflow
carries 2 M
with
example

d) Implement a C program to insert an element in an array.

4 M

Ans `#include<stdio.h>`
`#include<conio.h>`
`void main()`
`{`

Any correct
suitable
program

	<pre>int x,i,max=10,pos,K,n,a[10]; clrscr(); printf("Enter number of element"); scanf("%d",&n); if(n<max) { printf("Enter the element:\n"); for(i=0;i<n;i++) { printf("Enter element %d\t",i+1); scanf("%d",&a[i]); } printf("Array"); for(i=0;i<n;i++) { printf("\n element no %d is %d",i+1,a[i]); } printf("\n Enter the element to be added:"); scanf("%d",&x); printf("Enter the postion of the element where element to be added"); scanf("%d",&pos); for(i=n;i>=pos;i--) { a[i]=a[i-1]; } a[pos-1]=x; printf("Array with element inserted:"); for(i=0;i<n+1;i++) { printf("\n Element no %d is %d",i+1,a[i]); } } else { printf("Memory not available....\n try again 1=y,2=n"); scanf("%d",&K); if(K==1) main(); else exit(); } getch(); }</pre> <p>//OUTPUT /*Enter number of element5 Enter the element: Enter element 1 23 Enter element 2 32</p>	4 M
--	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----

		Enter element 3 65 Enter element 4 12 Enter element 5 45 Array element no 1 is 23 element no 2 is 32 element no 3 is 65 element no 4 is 12 element no 5 is 45 Enter the position of element to be added:89 Enter the postion of the element where element to be added 1 Array with element inserted: Element no 1 is 89 Element no 2 is 23 Element no 3 is 32 Element no 4 is 65 Element no 5 is 12 Element no 6 is 45 */			
3.		Attempt any <u>THREE</u> of the following:			12 M
	a)	Differentiate between tree and graph with respect to any four parameters.			4 M
Ans		Parameter	Tree	Graph	Any 4 correct points – 4 M
		Path	Only one between two vertices	More than one path allowed	
		Root node	It has exactly one root node	Graph may or may not have root node	
		Loop	No loop are permitted	Graph can have a loop	
		No. of edges	N-1	Not defined	
		complexity	Less complex as compared to graph	More complex as compared to tree	
		Traversal technique	Preorder, postorder and inorder	Breadth first search and depth first search	
		Parent child relationship	Parent child relationship exists	No parent child relationship exists	
		Application	Decision tree, sorting	Finding shortest path, route optimization.	
b)	Write an algorithm to delete an intermediate node in a singly linked list.			4 M	
Ans	Step 1: IF START = NULL			Correct algorithm – 4 M	

Write UNDERFLOW

Go to Step 1 [END OF IF]

Step 2: SET PTR = START

Step 3: SET PREPTR = PTR

Step 4: Repeat Steps 5 and 6 while PREPTR DATA != NUM

Step 5: SET PREPTR = PTR

Step 6: SET PTR = PTR NEXT [END OF LOOP]

Step 7: SET TEMP = PTR

Step 8: SET PREPTR NEXT = PTR NEXT

Step 9: FREE TEMP

Step 10 : EXIT

Consider the linked list shown in Fig. Suppose we want to delete the node that succeeds the node which contains data value 4. Then the following changes will be done in the linked list.

START

Take pointer variables PTR and PREPTR which initially point to START.

START
PREPTR
PTR

Move PREPTR and PTR such that PREPTR points to the node containing VAL and PTR points to the succeeding node.

START PREPTR PTR

START PREPTR PTR

START PREPTR PTR

Set the NEXT part of PREPTR to the NEXT part of PTR.

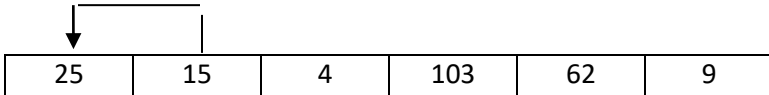

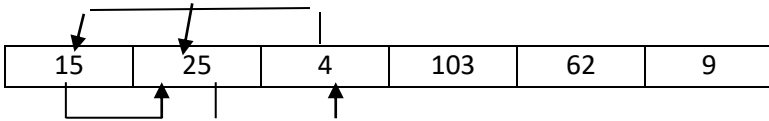

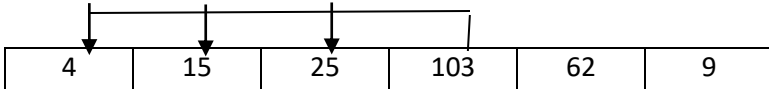

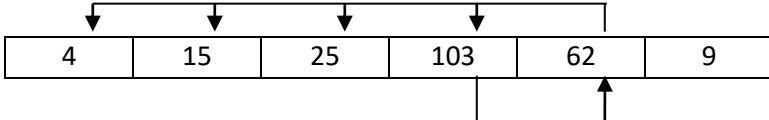

START

START

c)	Sort the following numbers in ascending order using Insertion sort: {25, 15, 4, 103, 62, 9} and write the output after each iteration.	4 M																		
Ans	<p>Pass1: 1st element is compared with all previous element (i.e., 0th element)</p> <div></div> <p>Since 25>15, move 25 to right and insert (place) 15 to its correct position.</p> <p>Array elements after pass 1</p> <div><table><tr><td>15</td><td>25</td><td>4</td><td>103</td><td>62</td><td>9</td></tr></table></div> <p>Pass 2: Second element is compared with all previous element (i.e., 0th and 1st)</p> <div></div> <p>Since 15>4 and 25>4 move 15 and 25 to right by one position and insert (place) 4 to its correct position.</p> <p>Array element after pass 2</p> <div><table><tr><td>4</td><td>15</td><td>25</td><td>103</td><td>62</td><td>9</td></tr></table></div> <p>Pass 3: 3rd element is compared with all previous elements (i.e., 0th, 1st and 2nd)</p> <div></div> <p>Since 4<103, 15<103 and 25<103, 103 is at its correct position.</p> <p>Array element after pass 3</p> <div><table><tr><td>4</td><td>15</td><td>25</td><td>103</td><td>62</td><td>9</td></tr></table></div> <p>Pass 4: 4th element is compared with all its previous elements(i.e. 0th, 1st, 2nd and 3rd)</p> <div></div>	15	25	4	103	62	9	4	15	25	103	62	9	4	15	25	103	62	9	Any Correct answer – 4 M
15	25	4	103	62	9															
4	15	25	103	62	9															
4	15	25	103	62	9															

4	15	25	103	62	9
---	----	----	-----	----	---

Compare 62 with 4, Since $62 > 4$,

Compare 62 with 15, since $62 > 15$,

Compare 62 with 25, since $62 > 25$.

Again compare 62 with 103, since $62 < 103$, move 103 to its right position by 1 element and insert (place) 62 to its right position i. e. $a[3]$.

Array after pass 4

4	15	25	62	103	9
---	----	----	----	-----	---

Pass 5: 5th element is compared with all its previous elements(i.e. 0th, 1st, 2nd, 3rd and 4th)

Compare 9 with 4, Since $9 > 4$,

compare 9 with 15, since $9 < 15$,

Compare 9 with 25, since $9 < 25$.

Compare 9 with 103, since $9 < 103$.

Shift or move 15, 25, 62 and 103 to its right by 1 position and insert(place) 9 to its correct position i. e. $a[1]$.

d) **Construct the Binary Search Tree using following elements :**

(35, 15, 40, 7, 10, 100, 28, 82, 53, 25, 3). Show diagrammatically each Step of construction of BST.

4 M

Ans Step 1:- Inserting Element 35

Correct
answer –
4 M

Step 2:- Inserting Element 15

Step 3:- Inserting Element 40

Step 4:- Inserting Element 7

Step 5:- Inserting Element 10

Step 6:- Inserting Element 100

Step 7: - Inserting Element 28

Step 8: - Inserting Element 82

Step 9: - Inserting Element 53

Step 10:- Inserting Element 25

Step 11: - Inserting Element 3

4.		Attempt any THREE of the following:	12 M																		
	a)	Differentiate between Binary search and Linear search with respect to any four parameters.	4 M																		
	Ans	<table><thead><tr><th>Linear Search</th><th>Binary Search</th></tr></thead><tbody><tr><td>Search element is compared with each element in list</td><td>Search element is compared with mid element only</td></tr><tr><td>Simplest method of searching</td><td>Comparatively difficult method of searching</td></tr><tr><td>Easy to implement</td><td>Comparatively difficult to implement</td></tr><tr><td>Given list of numbers can be sorted or unsorted order</td><td>Given list of numbers must be in sorted order</td></tr><tr><td>Linear search only requires equality Comparisons.</td><td>Binary search requires an ordering comparison.</td></tr><tr><td>Linear search has complexity O(n).</td><td>Binary search has complexity O(log n).</td></tr><tr><td>Linear search is too slow to be used with large lists due to its o (n) average case performance.</td><td>Binary search is considered to be a more efficient method that could be used with large lists.</td></tr><tr><td>Linear search only requires sequential Access.</td><td>Binary search requires random access to the data.</td></tr></tbody></table>	Linear Search	Binary Search	Search element is compared with each element in list	Search element is compared with mid element only	Simplest method of searching	Comparatively difficult method of searching	Easy to implement	Comparatively difficult to implement	Given list of numbers can be sorted or unsorted order	Given list of numbers must be in sorted order	Linear search only requires equality Comparisons.	Binary search requires an ordering comparison.	Linear search has complexity O(n).	Binary search has complexity O(log n).	Linear search is too slow to be used with large lists due to its o (n) average case performance.	Binary search is considered to be a more efficient method that could be used with large lists.	Linear search only requires sequential Access.	Binary search requires random access to the data.	Any 4 correct points – 4 M
Linear Search	Binary Search																				
Search element is compared with each element in list	Search element is compared with mid element only																				
Simplest method of searching	Comparatively difficult method of searching																				
Easy to implement	Comparatively difficult to implement																				
Given list of numbers can be sorted or unsorted order	Given list of numbers must be in sorted order																				
Linear search only requires equality Comparisons.	Binary search requires an ordering comparison.																				
Linear search has complexity O(n).	Binary search has complexity O(log n).																				
Linear search is too slow to be used with large lists due to its o (n) average case performance.	Binary search is considered to be a more efficient method that could be used with large lists.																				
Linear search only requires sequential Access.	Binary search requires random access to the data.																				
	b)	Create a singly Linked List using data fields 10, 20, 30, 40, 50 and show procedure step-by-step with the help of diagram from start to end.	4 M																		
	Ans	<p>Step 1: For creating a singly linked list, first create new node (first node) allocate memory for new node and initialised its data part to 10 and next part to null. Start address will point to the first node of linked list.</p> <table><tr><td>10</td><td>X</td></tr></table> <p>Start</p> <p>Step 2: To add 20 in singly linked list, create new node (second node) allocate memory for new node and initialised its data part to 20 and next part to null. Address of first node will point to the second node of linked list.</p> <table><tr><td>10</td><td></td><td>→</td><td>20</td><td>x</td></tr></table> <p>Step 3: To add 30 in singly linked list, create new node (third node) allocate memory for new node and initialised its data part to 30 and next part to null. Address of second node will point to the third node of linked list.</p>	10	X	10		→	20	x	Correct answer – 4 M											
10	X																				
10		→	20	x																	

		<div><div>10</div><div></div><div>→</div><div>20</div><div></div><div>→</div><div>30</div><div>x</div></div> <p>Step 4: To add 40 in singly linked list, create new node (fourth node) allocate memory for new node and initialised its data part to 40 and next part to null. 	<div>c)</div>	<div>Create a singly linked list using data fields 10, 20, 30, 40, 50. Search a node 40 from the singly linked list and show procedure step-by-step with the help of the diagram from start to end.</div>	<div>6 M</div>																																								

Ans		For correct answer 6m
	<div><div><div>10</div><div></div></div><div><div>20</div><div></div></div><div><div>30</div><div></div></div><div><div>40</div><div></div></div><div><div>50</div><div></div></div></div> <p>Node to be searched = 40</p> <p>Consider pointer ptr is used for traversal of Singly linked List</p> <div><div><div>10</div><div></div></div><div><div>20</div><div></div></div><div><div>30</div><div></div></div><div><div>40</div><div></div></div><div><div>50</div><div></div></div></div> <p>ptr</p> <p>will check ptr->infor =10</p> <p>Since 10 is not equal to 40</p> <p>set ptr = ptr->next</p> <div><div><div>10</div><div></div></div><div><div>20</div><div></div></div><div><div>30</div><div></div></div><div><div>40</div><div></div></div><div><div>50</div><div></div></div></div> <p>ptr</p> <p>will check ptr->infor = 20</p> <p>Since 20 is not equal to 40</p> <p>set ptr = ptr->next</p> <div><div><div>10</div><div></div></div><div><div>20</div><div></div></div><div><div>30</div><div></div></div><div><div>40</div><div></div></div><div><div>50</div><div></div></div></div> <p>ptr</p>	

will check $\text{ptr} \rightarrow \text{infor} = 30$

Since 30 is not equal to 40

set $\text{ptr} = \text{ptr} \rightarrow \text{next}$

10	
----	--

20	
----	--

30	
----	--

40	
----	--

50	
----	--

ptr

will check $\text{ptr} \rightarrow \text{infor} = 40$

Since 40 is equal to 40

Hence Node 40 is present in Linked list
